

TEAM KINYETI DATA CARD

Input vs. Output	What are users inputting (for example, audio, text, images)? What are the outputs or labels your model will predict or generate?	Input: Users, which will be the farmers will be inputting text in the form of a question or request. Output: Our embeddings model will retrieve the top relevant data from our corpus.
Classification problem	What is the classification task, if any? What categories or classes are you working with, and why?	There wouldn't be any classification in our project.
Labeling	Where do your labels come from—domain experts, community members, crowd workers, AI-generated sources? How will you check for consistency and accuracy?	We won't be labeling our data as we would not be fine-tuning any models including our explainer model.
Data creation	How will you collect your data? Will it come from direct sources (like interviews or recordings), or will you synthesize data in low-resource settings (e.g., for under-resourced languages)?	We will collect our data from the sites of various agricultural organizations like International Institute for Tropical Agriculture (IITA) and NATIONAL AGRICULTURAL EXTENSION AND RESEARCH LIAISON SERVICES (NAERLS) to serve as the knowledge base for our model. Our data set will not be for under-resource languages and will be in English but it will be easily usable by agricultural extension offers who can explain it to the farmers in their various Nigerian languages.

Web collection ethics	Do you plan to source data from the web? If yes, which sites or platforms? What tools will you use - AI tools, human workers, or both? Have you addressed issues of consent, copyright, and privacy?	Yes, we plan to source our data sets from the web through reputable agricultural organizations in Africa such as the IITA, International Institute of Tropical Agriculture and NATIONAL AGRICULTURAL EXTENSION AND RESEARCH LIAISON SERVICES (NAERLS). We won't be using any automated tools. We will browse through the sites like actual users searching for information on it. we would go through it manually and download information from the websites ourselves. On consent issues, we have addressed them by reviewing the robot.txt files for the websites to help us give us an idea of their data collection policies. The NAERLS had stricter robots.txt policies strictly prevent using the data for AI training. But the data is not used for training an AI model, rather it's serving as a knowledge base for it and we would not even be using automated methods which are bound by robot.txt guidelines. We would actually be downloading it directly from the site as actual users searching for information on the site which in itself references the documents as open source. We make sure though, to reference both NAERLS and IITA as the sources of the datasets.
Bias and representation	Who might be left out of your dataset? How will you ensure that the dataset reflects the diversity of the community and includes underrepresented voices?	Our project is targeted for African farmers but in reality our dataset is more tailored to Nigerian farmers meaning that other Africans might be left out of our dataset. Our IITA dataset is actually more universal and covers the African context far more but data from NAERLS is a lot more Nigerian but this will not affect the representativeness of our data

		sets. This is even why we would be mixing African relevant data from IITA with that from NAERLS which is more Nigerian focused. This will mean though that our target users will be Nigerians as the data set better represents them but at the same time it does not leave other Africans out from being able to use this model.
Values and community alignment	How does your dataset design reflect the values you identified in 01 Build Your Own Small Language Model How will your community benefit from this dataset, and how will you ensure accountability to them?	Our dataset design reflects our core values of transparency by clearly stating where the data source is from so the extension officer or the user knows where it is from and can reference it for more information (if possible). The values of accessibility and inclusivity are well catered for by ensuring that everyone, including the rural farmers, are able to access timely info to help them in their various farming endeavors. And as for accuracy, the sites we got these data sets are trustworthy and reliable for accurate information. To remain accountable, we would ensure we continue to clearly state the source of our datasets and ensure that they are from trustworthy sources.
